

ABSTRACT

An electromagnetic wave shielding filter for a plasma display panel, for example, and a method of manufacturing such a filter includes preparing a substrate such as a metal plate that can act as a seed layer for electrolytic plating; forming a mesh plating layer on an upper surface of the metal plate; adhering an adhesive film to an upper surface of the plating layer; and separating the adhesive film from the metal plate so that the plating layer is adhered to a lower surface of the adhesive film. An electromagnetic wave shielding layer, which is installed to shield electromagnetic waves generated during the driving of a plasma display panel, for example, is formed in a mesh pattern, and the mesh pattern is created on a metal plate by electrolytic plating.
